docs_chain_md_to_db.sh

Revision: 1 Last modified: 2026-06-26T15:30:00Z

Overview

Wrapper script that bridges the docs_chain exec transform to the workable_items_loader.py script. Called by docs_chain when the WBS source markdown files change (content-hash drift detected).

Prerequisites

- Python 3.10+ (for the loader)
- docs_chain binary (submodules/docs_chain/docs_chain)
- WBS source docs at canonical paths

Usage

```
# Called automatically by docs_chain sync:  
submodules/docs_chain/docs_chain sync workable-items
```

```
# Or directly:  
./scripts/docs_chain_md_to_db.sh
```

How it works

1. docs_chain detects content-hash drift in WBS source nodes
2. docs_chain invokes this script as the exec transform
3. The script calls workable_items_loader.py which reads all WBS files
4. The loader clears and re-populates the SQLite DB
5. docs_chain records the new content hash
